Packet Capture Tool: Wireshark

Aim: Experiment on Packet capture tool: Wireshark.

Packet Sniffer:

A Packet Sniffer snifs the packets sent from / by a computer, it then stores and displays the contents of the message of the various protocols in human readable format. It never sends packets by itself.

Wireshark:

* The Wireshark is a network analysis tool that captures the contents of packets in real-time and displays them in human-readable format.
* Wireshark includes filters, colour coding, etc..
* It is used to inspect suspicious programs network traffic, analyze traffic flow.

Applications of Wireshark:

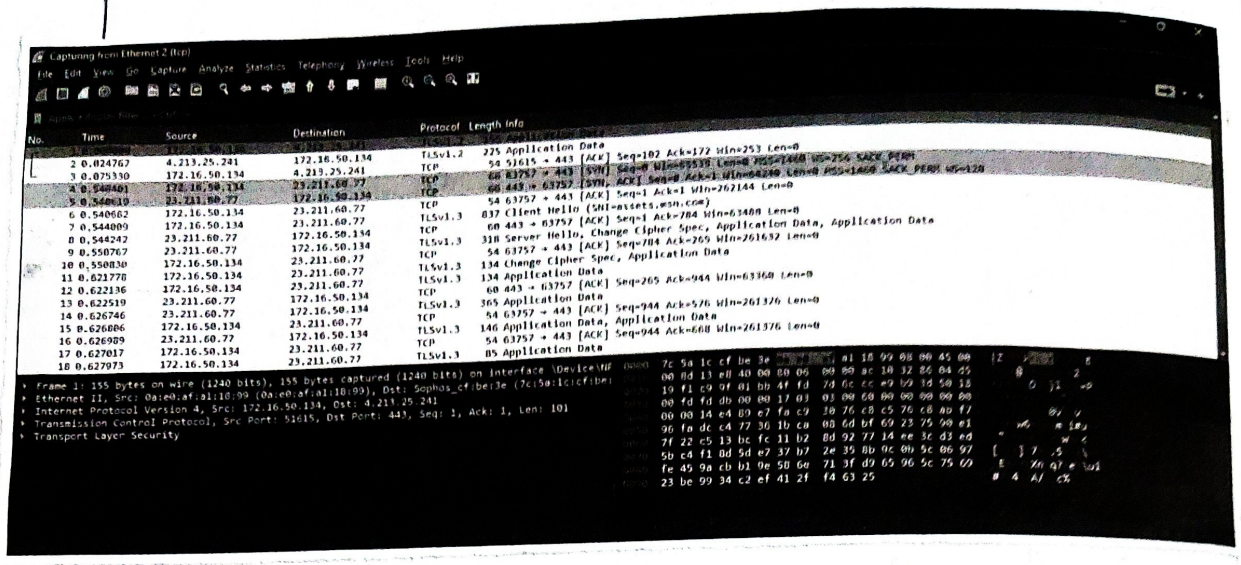

* Troubleshoot network problems
* Examine security problems
* Debug protocol implementations
* Learn network protocol internals.

1. Display the TCP packets.

Procedure:

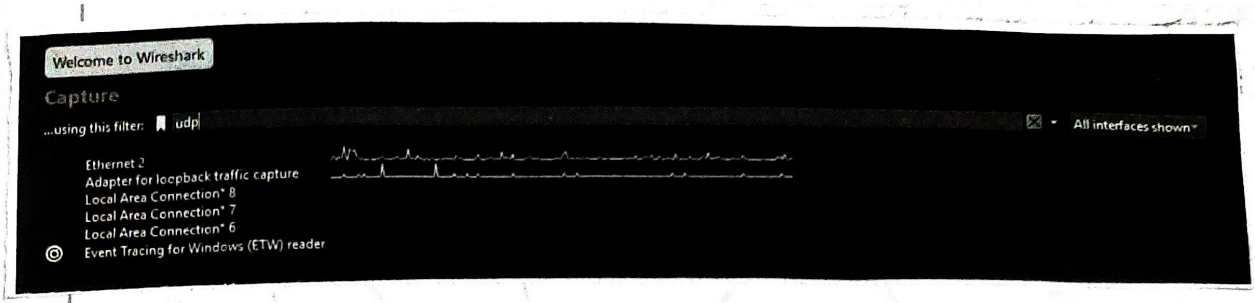

* Open the Wireshark and in the Capture window, select the network interface "Ethernet".
* Then use the filter ".tcp" to capture and display the TCP packets.
* This will display the "Packet List", "Packet Details", and "Packet Bytes".

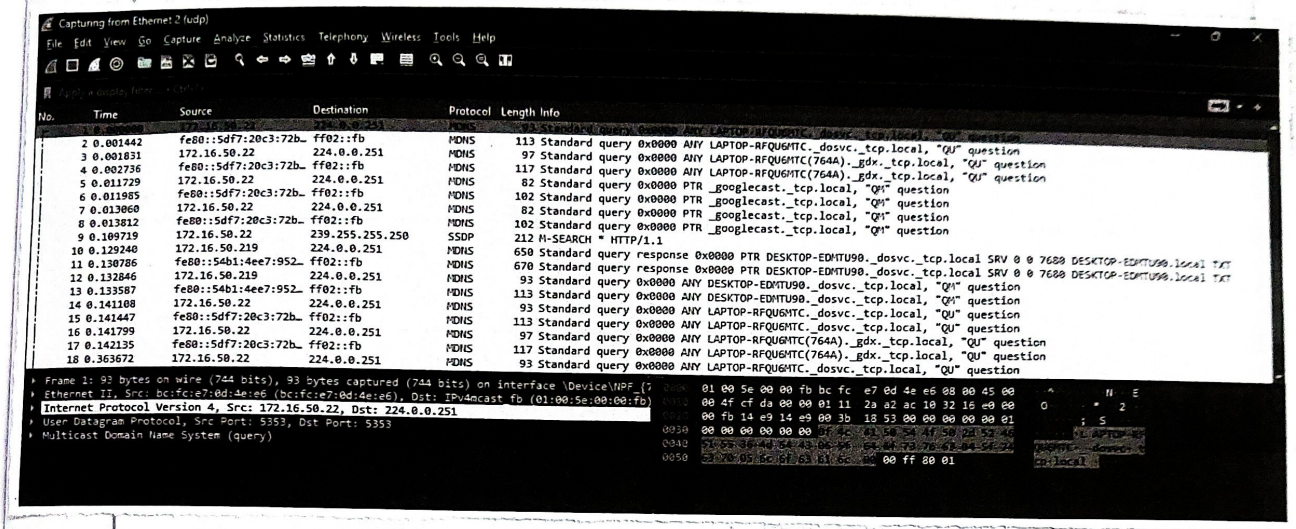

2. Display UDP packets:

* Open the Wireshark, and in the Capture window select the network window.
* Select the network window Ethernet.
* Then use the "udp" filter to display the UDP packets.
* This will display the "Packet List", "Packet Details", and "Packet bytes".

Result:

The packet sniffing process using Wireshark has been completed.
